

CXi Series V-Twin Engine With Oil Xtend™ Technology

The Briggs & Stratton® [CXi Series V-Twin engines](#) are engineered to maximize uptime and keep users on the jobsite longer. The new Oil Xtend™ system (optional) allows end users to work up to 250 hours between maintenance intervals for oil changes, oil filter, spark plugs, fuel filters and air filters — 2.5 times the industry standard. When the time does come for an oil change, the oil filter housing on the Oil Xtend system is six times larger, resulting in a quick and clean oil change — no funnel needed.

Also included with the Oil Xtend system is a new high-inertia flywheel, which reduces engine vibration and delivers smoother power. CXi Series engines feature best-in-class debris management and a significantly larger automotive-style air filter which keeps dirt and debris away from the engine, extending engine life even in the harshest conditions.
